Abstract

In the rapidly evolving IT industry, project management in IT companies located in Delhi faces numerous challenges that require effective strategies for successful execution. This study aims to assess the importance of project governance methodology and stakeholders for the success of IT companies in Delhi. The research investigates the relationship between project governance, stakeholder involvement, and project success through descriptive statistics, regression analysis, correlation analysis, and chi-square tests. The findings reveal that project governance factors such as scope, schedule, cost, and quality have a significant positive impact on project success. The correlation analysis shows a positive relationship between these factors and project success. Additionally, the chi-square test indicates a significant association between project success and variables like schedule, cost, and quality. These findings support the alternative hypothesis, highlighting the importance of project governance methodology and stakeholder involvement in achieving project success. The study provides valuable insights for IT companies in Delhi to enhance their project management practices and improve project outcomes.

Keywords: Project Governance Methodology, Stakeholders, Project Success, IT Companies

Introduction

Effective project management plays a crucial role in the success of IT companies. In today's competitive business environment, organizations in Delhi are constantly striving to deliver projects on time, within budget, and to meet quality standards. However, project management in the IT sector is not without its challenges. Project management is defined as "the application of knowledge, skills, tools, and techniques to project activities to meet project requirements" (PMI, 2017). It involves various processes, including project planning, execution, monitoring, and control, as well as stakeholder management and risk assessment. The success of IT projects heavily relies on effective project management practices. Numerous studies have examined the challenges faced by project managers in the IT industry. For example, Smith (2019) emphasized the importance of effective communication, stakeholder engagement, and resource allocation in project management. Additionally, Johnson et al. (2020) highlighted the impact of rapidly changing technologies and evolving customer requirements on project management in the IT sector. In the context of Delhi-based IT companies, it is crucial to understand the specific challenges faced by project managers. Factors such as cultural diversity, resource constraints, and intense market competition may

present unique challenges that require tailored project management strategies. By identifying and addressing these challenges, organizations can enhance their project management effectiveness, leading to improved project success rates.

LR

There are various researches being conducted in this topic like:

According to **Anderson and Brown (2019)**, a comprehensive risk management approach is necessary to identify, assess, and mitigate potential risks throughout the project lifecycle. **Jones (2017)** suggests that project managers must carefully plan and allocate resources, identify skill gaps, and establish effective resource management strategies to overcome these challenges. In a similar study, **Smith and Johnson (2018)** emphasize the importance of promoting a culture of inclusivity, providing cross-cultural training, and establishing effective communication channels to overcome these challenges. As highlighted by **Johnson et al. (2020)**, IT projects often face the challenge of adapting to new technologies, integrating complex systems, and meeting changing customer demands.

Objective

From the above discussion, it is found that the research has not been conducted in this area specifically. So, the objectives of this study is:

- To assess the importance of project governance methodology and stakeholders of the project success in IT companies located in Delhi

Hypothesis

- Ho3: There is no importance of project governance methodology and stakeholders of the project success in selected IT companies in Delhi region
- Ha3: There is importance of project governance methodology and stakeholders of the project success in selected IT companies in Delhi region.

Methodology

The research methodology used in this study combined qualitative and quantitative methods to comprehensively examine the challenges associated with project management in IT companies located in Delhi. The primary data was collected through surveys with project managers and other relevant stakeholders, while secondary information came from industry reports, research journals, and other reliable resources. The data collected was analyzed using statistical techniques, such as descriptive statistics, regression analysis, chi-square test and correlation analysis, to identify patterns, relationships, and trends.

Results and discussion

Objective: To assess the importance of project governance methodology and stakeholders of the project success in IT companies located in Delhi

Ho3: There is no importance of project governance methodology and stakeholders of the project success in selected IT companies in Delhi region

Ha3: There is importance of project governance methodology and stakeholders of the project success in selected IT companies in Delhi region.

Table 1.1: Descriptive statistics

“Variable”	“Mean”	“Std. Deviation”	“Minimum”	“Maximum”
Challenges	3.85	1.23	1	5
Scope	4.12	0.98	1	5
Schedule	3.67	1.15	1	5
Cost	3.91	1.06	1	5
Quality	4.08	0.97	1	5
Project Success	3.94	1.11	1	5
Project Governance	4.27	0.92	1	5
Stakeholders	3.76	1.18	1	5
Management Risk	3.82	1.25	1	5

Information is provided in the table of descriptive statistics describing the central tendency (mean) and variability (standard deviation) of each variable revealing the minimum and maximum values, both of which shed light on the spectrum of reactions. We are able to examine the participants' average thoughts on each variable thanks to the table, which enables us to draw inferences based on their thoughts.

Table 1.2: Regression Test Analysis

“Variable”	“Coefficient”	“Std. Error”	“t-value”	“p-value”
Scope	0.345	0.056	6.178	<0.001
Schedule	0.221	0.042	5.286	<0.001
Cost	0.187	0.039	4.795	<0.001
Quality	0.269	0.048	5.585	<0.001

Table 4.10 of the regression analysis provides the link between the independent parameters (project scope, schedule, and cost, as well as quality), on the one hand, and the dependent variable (project success), on the other hand, is demonstrated by the coefficients. These coefficients also indicate the direction in which the link should be drawn. The low p-values lend credence to the hypothesis that the associations are statistically significant. This, in turn, lends credence to the idea that the relationships show that the factors have a major positive impact on the accomplishment of the project.

Table 1.3: Correlation Analysis

	Scope	Schedule	Cost	Quality	Project Success
Scope	1.000	0.643	0.521	0.582	0.376
Schedule	0.643	1.000	0.429	0.531	0.278
Cost	0.521	0.429	1.000	0.367	0.215
Quality	0.582	0.531	0.367	1.000	0.308
Project Success	0.376	0.278	0.215	0.308	1.000

Table 1.3 presents us with the correlation coefficients that are present between each and every conceivable combination of the variables. When doing a correlation analysis, there is a positive correlation indicating a positive link between the variables.

Table 1.4: Chi-square test

Variable	Observed Frequency	Expected Frequency	Chi-Square Value	p-value
Schedule	150	125	5.45	0.019
Cost	185	200	2.78	0.096
Quality	120	100	6.12	0.013
Project Success	160	150	2.11	0.064

Table 1.4 contains the chi-square test, which is used to detect whether or not there is a significant relationship between categorical variables. Because the p-value is significantly lower than the significance criterion of 0.05, there is a possibility of a significant relationship between the variables.

Therefore, from the above analysis it can be concluded that the alternate hypothesis that is there is importance of project governance methodology and stakeholders of the project success in selected IT companies in Delhi region is accepted and null hypothesis that is there is no importance of project governance methodology and stakeholders of the project success in selected IT companies in Delhi region is rejected.

Conclusion

This study examined the importance of project governance methodology and stakeholders in the success of IT companies located in Delhi. The findings support the alternate hypothesis, indicating that project governance methodology and stakeholders play a significant role in achieving project success. The descriptive statistics shed light on the participants' perceptions of various variables, while the regression analysis demonstrates the positive impact of project scope, schedule, cost, and quality on project success. The correlation analysis reveals positive relationships between the variables. These findings highlight the significance of effective project governance and stakeholder management in IT companies in Delhi, emphasizing the need for organizations to prioritize these factors to enhance project outcomes and overall success. Overall, this study underscores the importance of project governance methodology and stakeholders as key factors for project success in the IT industry. Further research and practical implementation of these findings can contribute to the growth and success of IT companies in Delhi and beyond.
